Re-establish Patient Eye Contact

Clinical exams have been impersonalized by technology, leaving patients feeling marginalized and less satisfied. This negative experience usually comes down to lack of eye contact.

When clinicians break eye contact with patients to view the patient's medical chart and/or enter progress notes on a computer or tablet, natural communication is interrupted. To correct this, clinicians can now easily and securely transfer images and information from their computer or tablet to a wall-mounted flat panel display, enabling them to re-establish eye contact with their patients and keep them engaged in the case-review process.

Enhance Communication and Patient Experiences

The Intel Unite® solution lets you easily create and manage a secure content sharing and collaboration platform with your patients. This interactive experience lets clinicians:

- Display medical records and test results
- Draw with a mouse or digital finger to highlight areas of interest
- Conduct collaborative telemedicine consultations with a split-screen
- Project educational videos and other content

Additionally, the powerful flexibility of the Intel Unite system facilitates interaction with IOT devices, allowing clinicians to perform functions like controlling lighting and room temperature or displaying data from wearables.

With Intel Unite, healthcare professionals can share charts and medical reports more securely with patients, and consult team members on-site and off. Intel Unite provides an easy-to-implement collaboration platform that supports better patient care and caregiver experiences.
