Meraki Experiences

Bringing together touchpoints, like people and places, with technologies, like security and intelligence, to create experiences based on customer needs.

Workforces

Hybrid Workforce

The office of the future is where your employees choose to sit, whether choosing a personalized workspace at home or opting for the interactions in an office. Organizations must facilitate both while making the work experience seamless and productive, no matter where employees choose to sit. Take complexity out of the mix through a platform that converges IT connectivity, physical and network security, and intelligence.

Remote Workforce

Managing the remote workforce experience with one centralized IT team has been difficult and time consuming. Remote employees also face inconsistent connectivity and challenges in reaching key business applications. Bring a platform that can be managed from anywhere and keep employees productive with a secure, optimized connection to your network and business applications from any location.

Workspaces

Smart Spaces

Organizations need to manage costs and maximize resources, and automation is a critical component of these efforts. Smart spaces are offices, commercial, public or restricted spaces that utilize networks and IoT devices to collect data, to proactively manage and automate environments, and to create healthy, sustainable spaces while accelerating IT productivity and performance. Deliver the future to your workspace through IoT technologies.

Safe Environments

Ensuring complete connectivity and coverage of multiple locations is easier said than done. Physical and network security is often a cross-organizational challenge that can benefit from integrating physical and network security into a single point of control. Whether protecting people, places, or things, the need to customize security based on business needs is key to protecting what matters most.
